

C-TPAT Seal Inspection Training

A seal inspection process should be implemented throughout the supply chain. The **V.V.T.T.** Seal Inspection Process is a good example of one:

View seal and container locking mechanisms. Excessive damage to the seal or locking mechanisms must be reported to a Supervisor before opening the container.

Verify seal number for accuracy. Compare with shipping documents, and look for alterations to the seal numbers.

Tug on seal to make sure it is affixed properly. Seals that come apart must be reported to a Supervisor before opening the container. Human error might cause this to happen, or the container might have **contraband** inside.

Twist & Turn seal to make sure it does not come off. Seals are threaded, so they can be unscrewed. These altered seals are reusable throughout the supply chain for multiple attacks.
